

# Real-time Mobile Food Recognition System

Yoshiyuki Kawano and Keiji Yanai  
Department of Informatics,  
The University of Electro-Communications,  
Tokyo, JAPAN

# Background

- Recording of food habits has become popular.
  - by using PC or mobile phone
  - quite troublesome task.
- Rapid progress of smartphone
  - obtain enough computational power for real-time image recognition

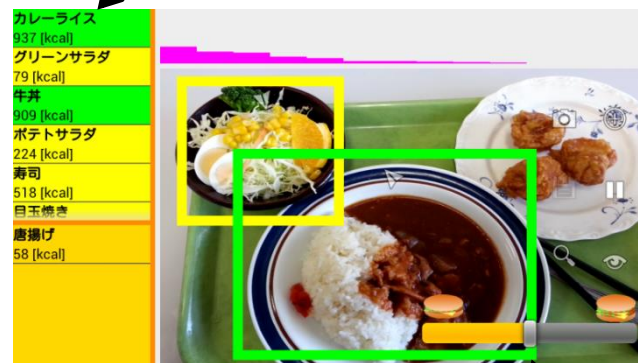

# Objective

## Mobile Food Recognition System

- recognize food in **real-time**
- require **no connection** with server
  - Recognition on a smartphone
- **interactive** system
  - bounding box is given by user

### Recognition Result

Selected Food

Volume

# Flow of proposed system

Point a smartphone toward food items

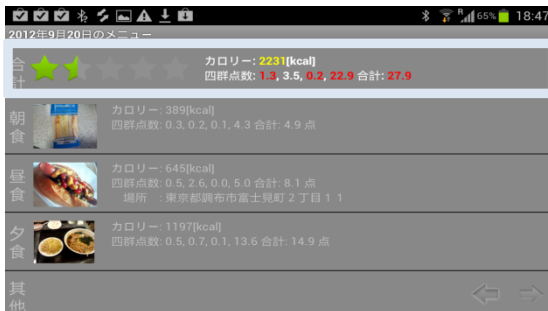

Draw bounding box

Real-time recognition

Check balance

Nutrition information  
Register food record

Select food items

# Demonstration

# Related Work (1)

- [Matsuda et al. ICME'12]
  - 100 kinds of food categories
  - carry out on server side

**Food Image**

- | Result |                   |
|--------|-------------------|
| 1.     | Rice              |
| 2.     | miso soup         |
| 3.     | Egg sunny-side up |
| 4.     | Sirloin cutlet    |
| 5.     | Salmon meuniere   |
| 6.     | Fried fish        |
| 7.     | Boiled fish       |
| 8.     | Sausage           |
| 9.     | Sandwiches        |
| 10.    | Roll bread        |

## Related Work (2)

- Google Goggles
  - Specific object recognition
  - Similar image search
  - OCR

- Leaf snap(Kumar et al,ECCV'12)
  - Identifying plant species

All the systems adopt server-side recognition

# 3 key features of the system

- Bounding box adjustment
- Real-time image recognition
- Estimation of the more reliable direction

# Bounding Box Adjustment

- Restriction : A user draws bounding boxes covering food items by touching
- Performed only once after bounding box was drawn

**GrabCut**

# Food Recognition

- Image Features:
  - Color Histogram
    - $64 \times (3 \times 3) = 576\text{dim}$
  - SURF-BoF
    - code book size : 500
    - soft assignment

# Food Recognition

- Classifier:
  - Linear SVM

$$\begin{aligned}
 f(x) &= \sum_{i=1}^M y_i \alpha_i K(\mathbf{x}, \mathbf{x}_i) + b \\
 &= \sum_{i=1}^M y_i \alpha_i \langle \mathbf{x}, \mathbf{x}_i \rangle + b \\
 &= \left\langle \sum_{i=1}^M y_i \alpha_i \mathbf{x}_i, \mathbf{x} \right\rangle + b \\
 &= \langle \mathbf{w}, \mathbf{x} \rangle + b
 \end{aligned}$$

Independent of the  
number of samples

computation:  $O(N)$

memory :  $O(N)$

# Food Recognition

- fast  $\chi^2$  feature map (Vedaldi et al, PAMI'12)
  - approximate the implicit feature mapping
  - the same accuracy as non linear SVM
  - speed comparable with linear SVM

$$\phi(x) = \sqrt{x} \begin{bmatrix} 0.8 \\ 0.6 \cos(0.6 \log x) \\ 0.6 \sin(0.6 \log x) \end{bmatrix}$$

# Estimation of the more reliable direction

- Effective window search
- No transposed SURF-BoF + linear SVM
  - Linear SVM
 
$$\mathbf{w} = \mathbf{w}^+ + \mathbf{w}^-$$
  - SVM score
    - Create integral images about  $\mathbf{w}^+$  and  $\mathbf{w}^-$
    - $O(1)$  operation ( refer to ESS (Lampert et al, CVPR '08))
- Show the result
  - The window with the maximum score

# Demonstration of estimation the more reliable direction

# Experiment

- Experiment description
  - Recognition accuracy
  - Processing time
  - User study

# Set up

- Recognition accuracy
  - Dataset
    - includes 50 kinds of food categories
    - has more than 100 images for each category

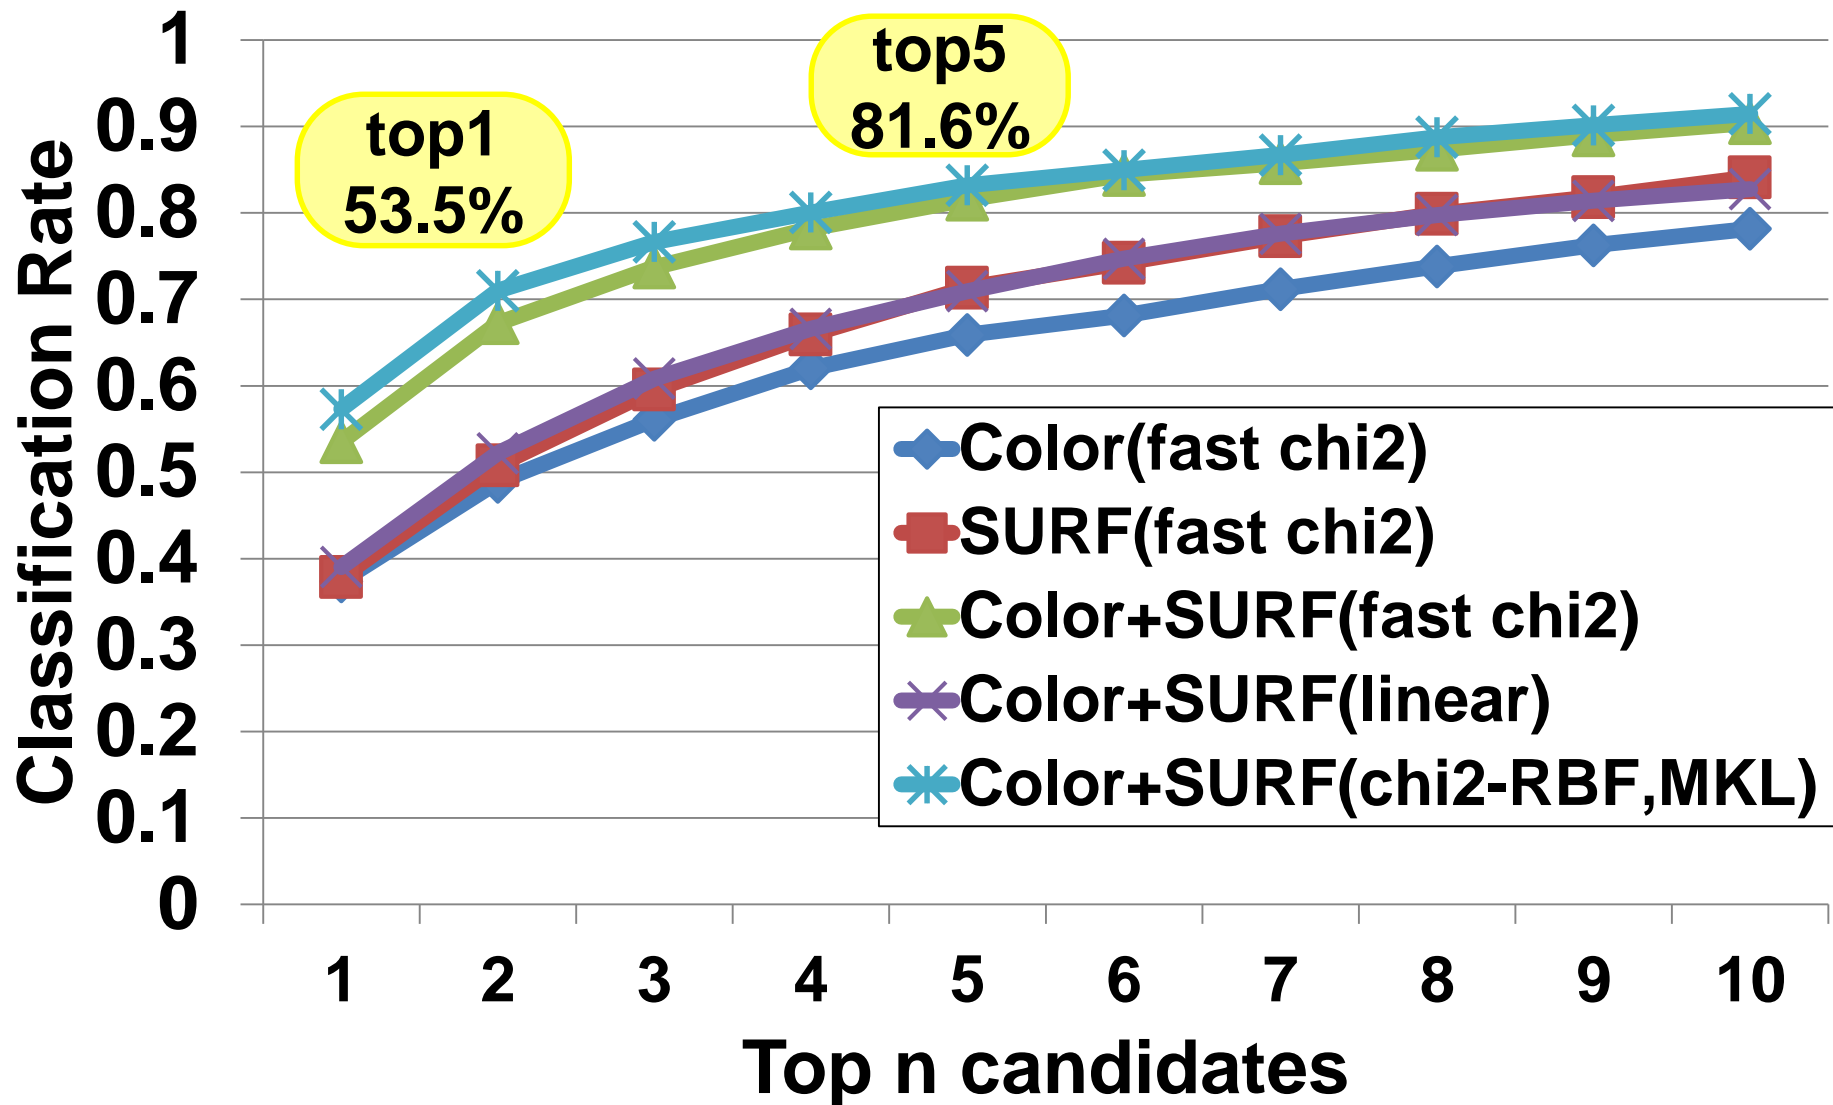

- processing time
  - device
    - Galaxy Note2 (1.6 GHz, 4 core, 4 thread)
  - multi thread for Quad core

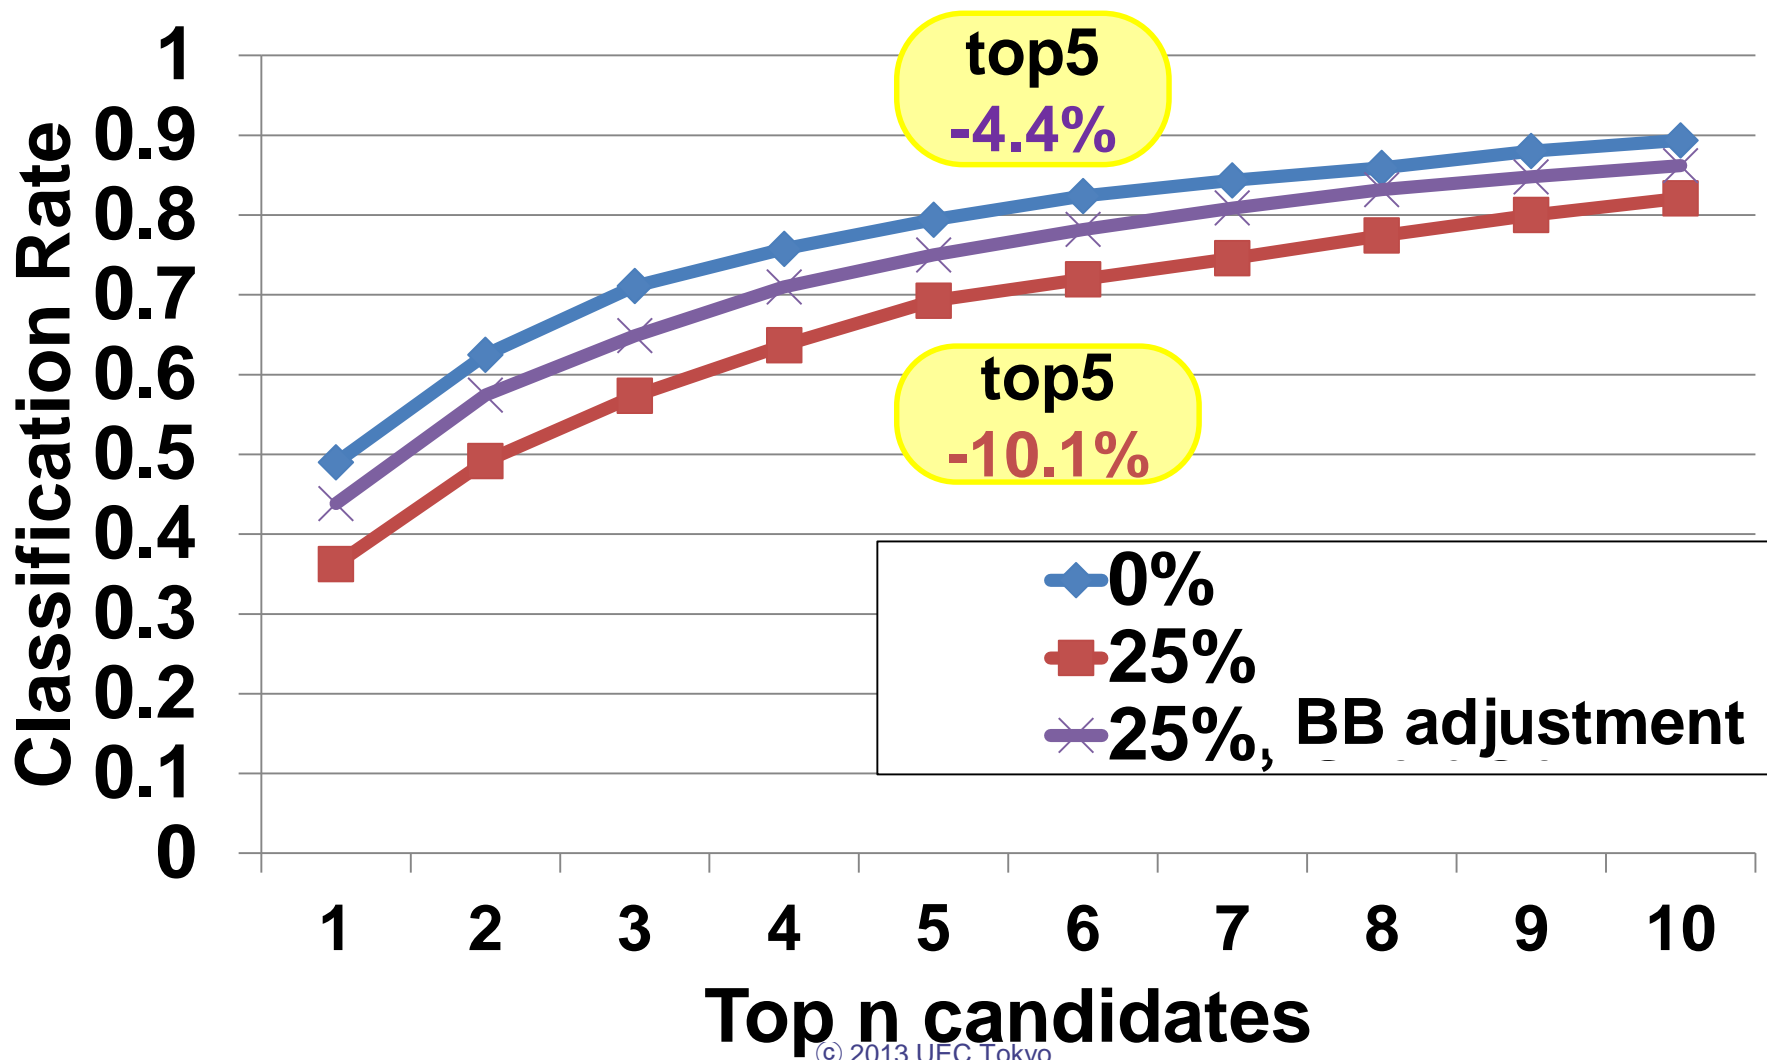

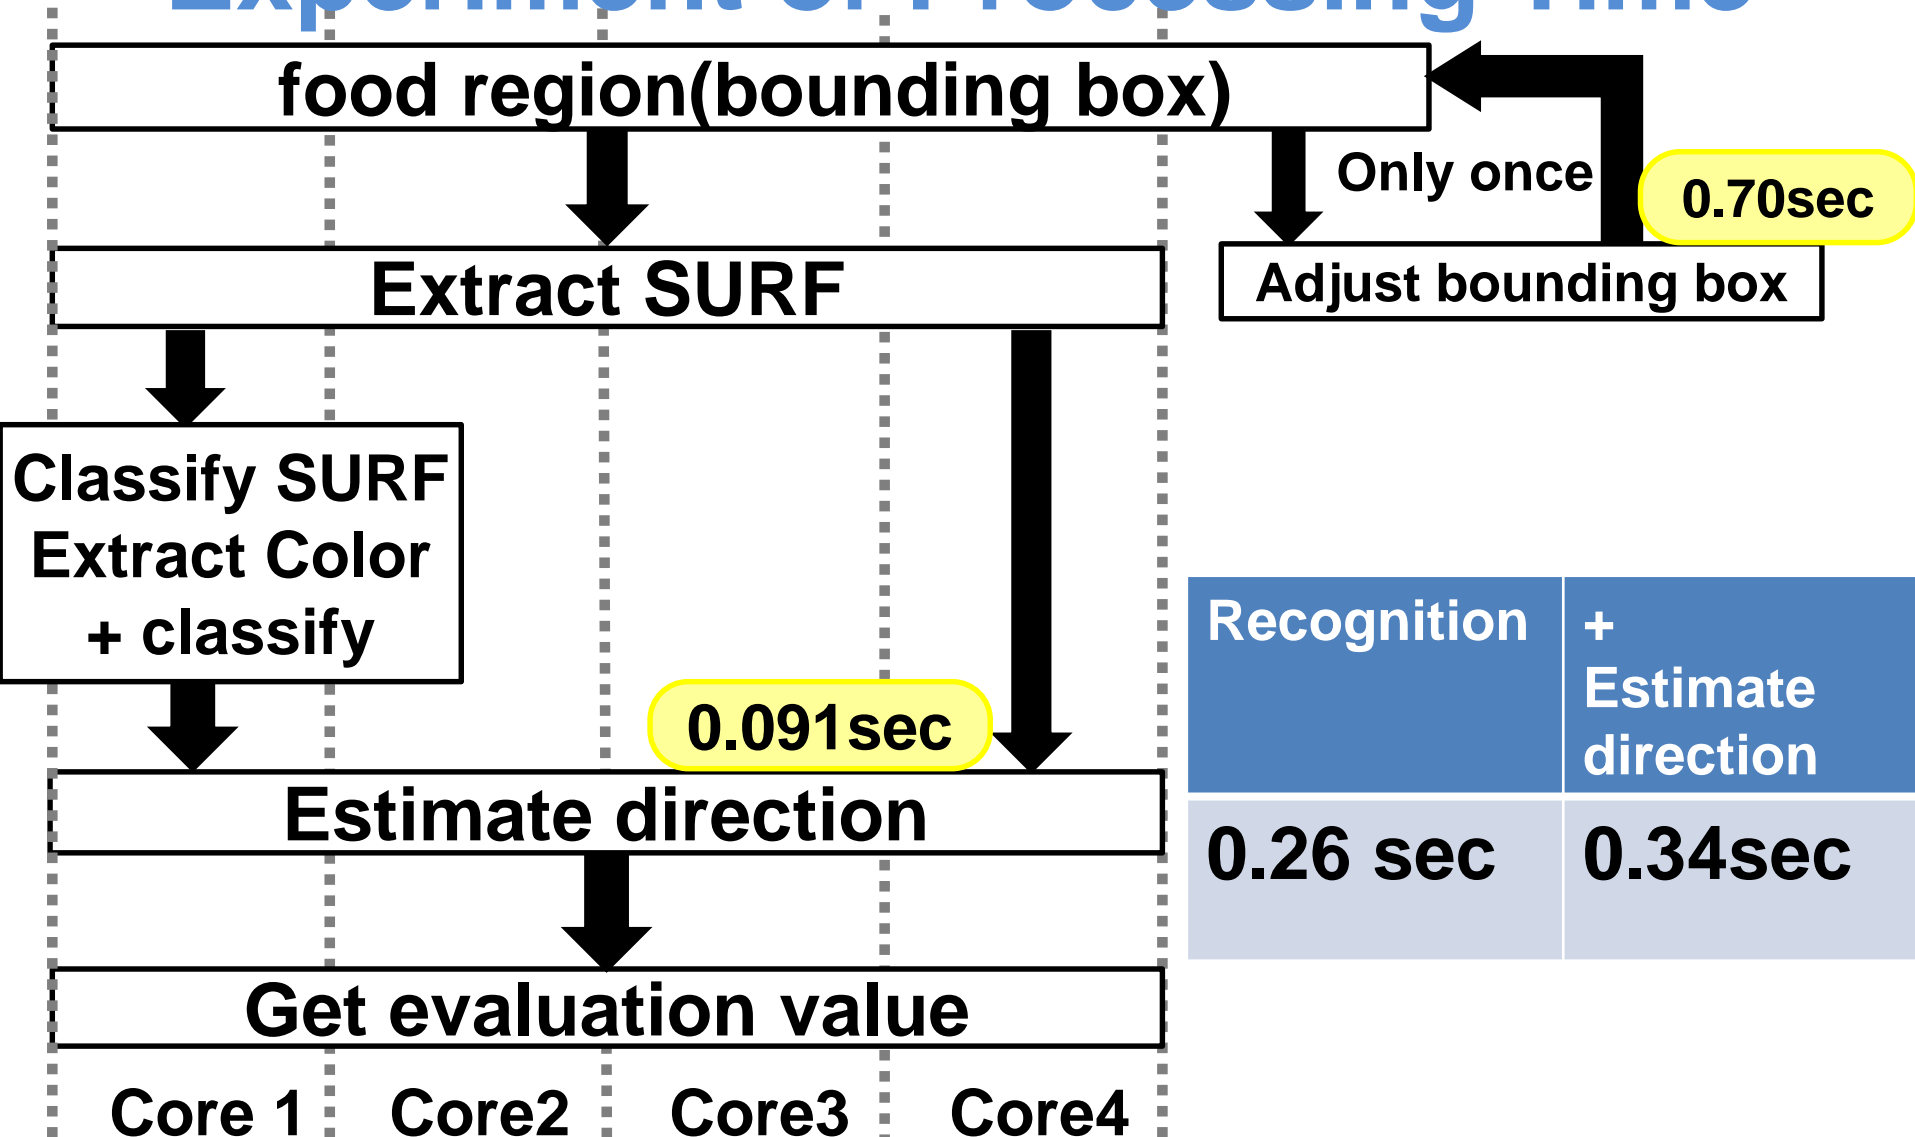

# Evaluation of Recognition Accuracy

# Evaluation of Bounding box adjustment

# Experiment of Processing Time

# User Study

- Subject
  - Five students
- Evaluation
  - 3 food items in a meal, 2 trial, 3 or 4 meal
  - Outcome Measure (5 step) **bad** **good**  

1		3		5
---	--	---	--	---
  - Recognition Accuracy
  - Usability
  - Estimation direction
  - Which is better, proposed or manual system?

# User Evaluation

- Result(average value)

Recognition Accuracy	3.4
Usability	4.2
Estimation direction	2.4
Which is better proposed or manual	3.8

# Comments from subjects

- comment
  - If accuracy is improved, I want to try it
  - exclude food items of incorrect result from list
  - increase the number of food categories
- summary
  - unable to recognize some food items
  - Proposed system better than manual system

# Conclusions

- recognize 50 kinds food categories
- run on common smartphone
- adjust bounding box in the background
- estimate of the more reliable direction

# Future Work

- draw bounding box
  - Make less complex such as touch just a point
- use additional information
  - User's meal history
  - GPS and time information

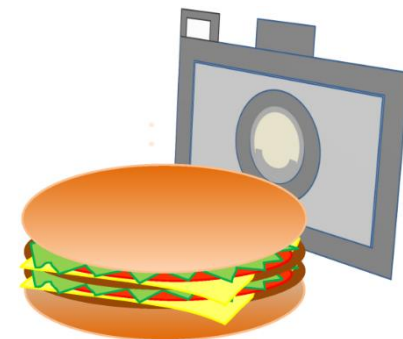

# You can try it

- <http://foodcam.mobi/>

Requirements : Android 4.0 and up

: Quad core CPU

(No iPhone version)

# Meal Records

on the smartphone

on the Web

# 4-Gun

# Data Set

- 50 kinds food items

# Demonstration

# Demonstration of estimator

# Demonstration

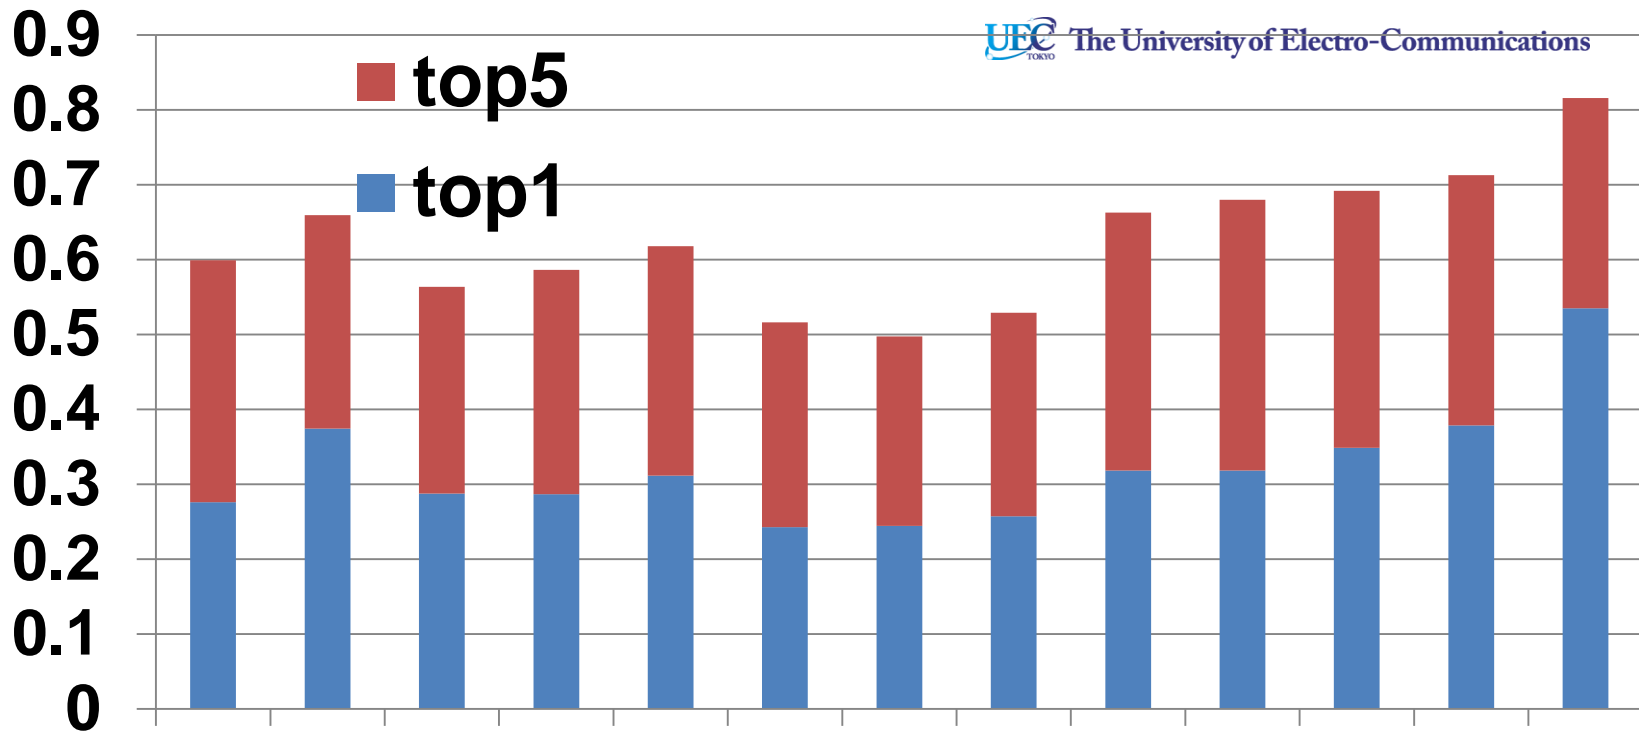

# Demonstration

# Classification Rate

Color Histogram(RGB, sqrt)  
 Color Histogram(RGB, chi2)  
 Color Histogram(HSV, chi2)  
 Color Moment(RGB+HSV)  
 Color Auto Correlogram(RGB)  
 Gabor  
 HOG  
 PHOG(chi2)  
 SURF(sqrt, hard, 500)  
 SURF(sqrt, soft, 500)  
 SURF(sqrt, soft, 1000)  
 SURF(chi2, soft, 500)  
 Color Histogram+SURF

## Feature Type

# Set up for Experiment

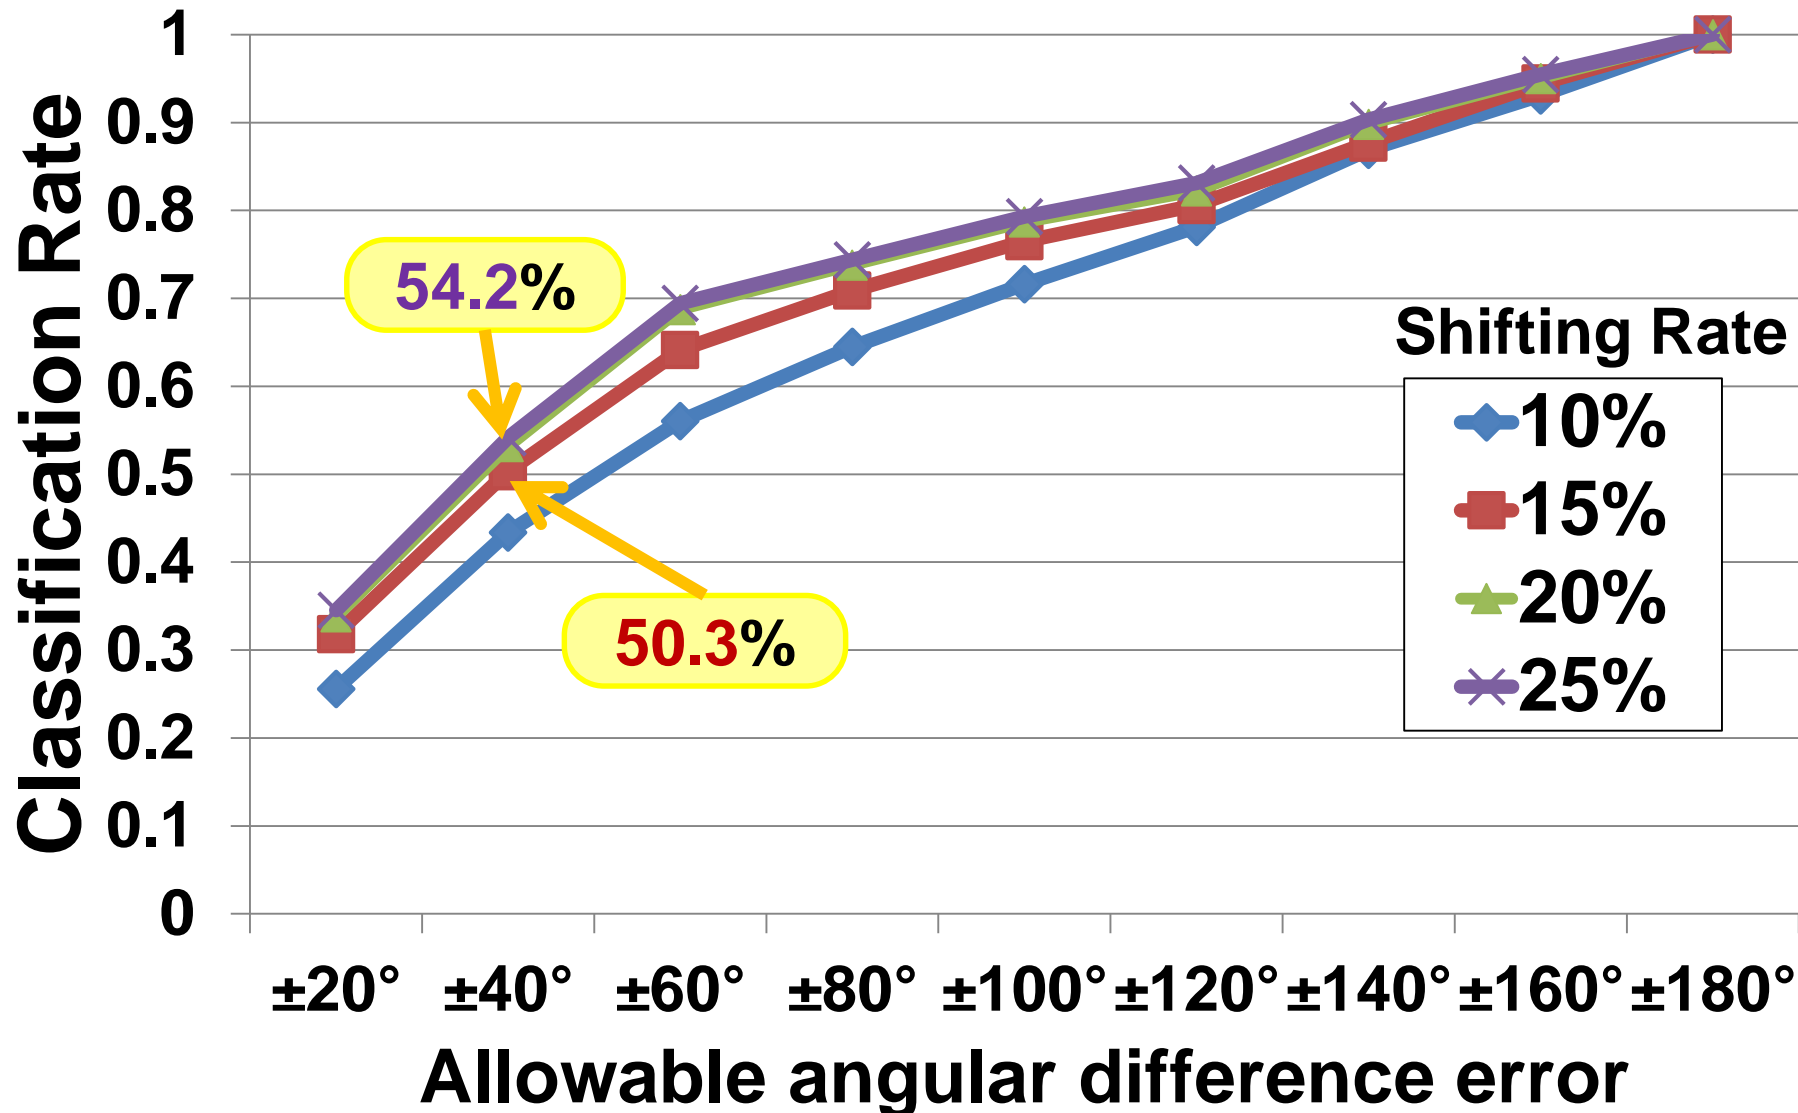

- Dataset (test)
  - Shifting the ground-truth bounding boxes –  $x\%$
  - To each of eight directions

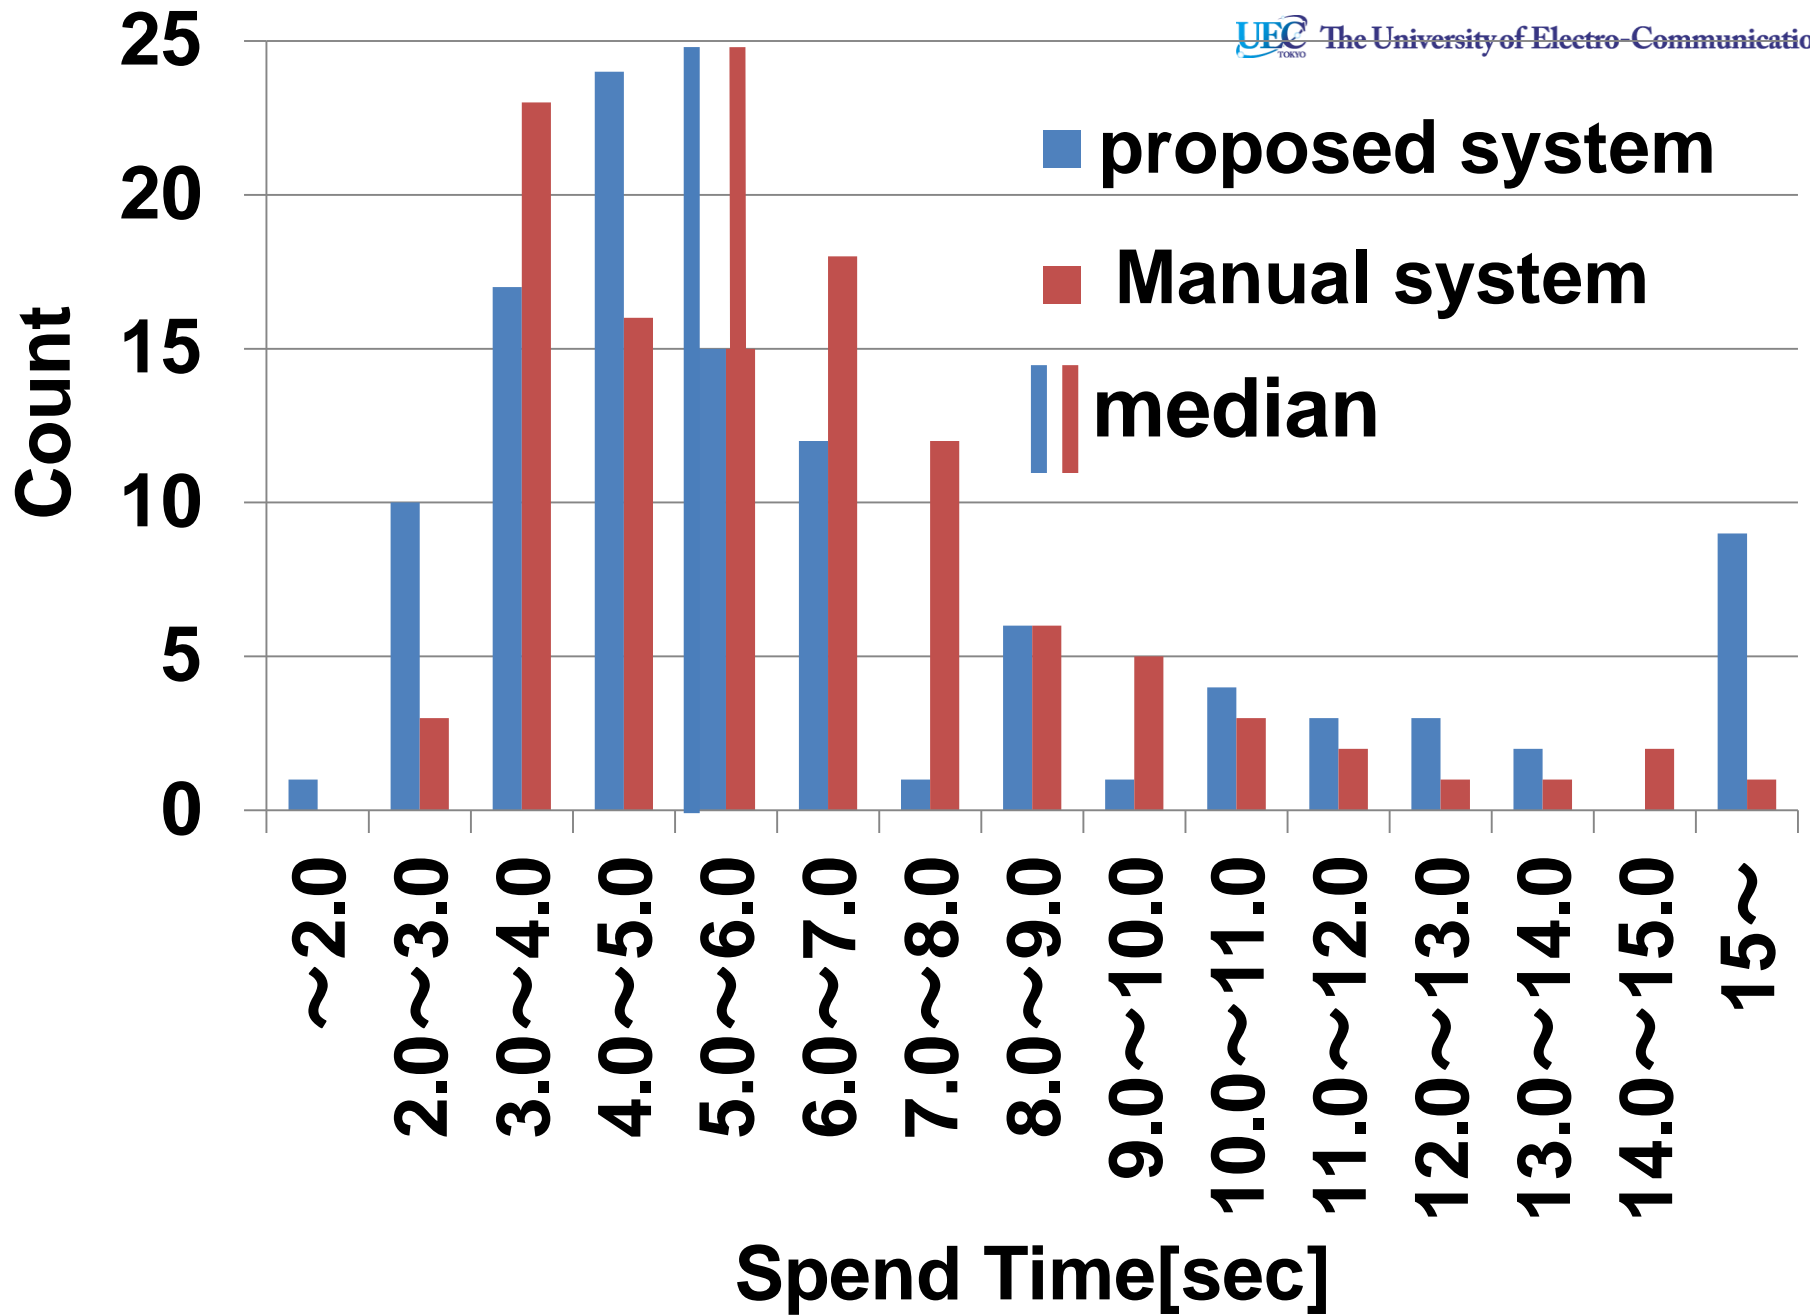

- Evaluation
  - Error in the direction estimation
  - Cumulative classification rate

$$\frac{\text{number of less than } y^0}{\text{number of all the test images}}$$

# Experiment of estimation direction

# Set up for Experiment

- Dataset
  - Includes 50 kinds of food categories
  - Has more 100 images for each category

- Performance:
  - Classification Rate = 
$$\frac{\text{number of correctly detected images in Top } n}{\text{number of all the test images}}$$

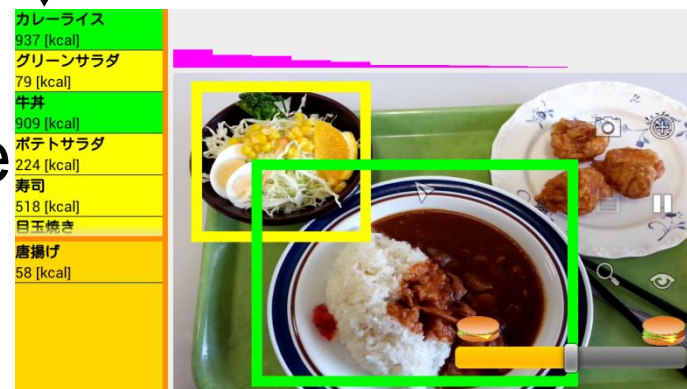

# Objective

- To record food items in every meal
  - quite troublesome task.

**More Quickly and Easier**

- Proposed System
  - Recognize food in **real-time**
  - require no connection with server

## Recognition Result

Selected Food

Volume

# Flow of recognition and record

## Start recognition

## Draw bounding box

## Select food items

## Register food record

Point a smartphone toward food items

# Bounding Box Adjustment

- Why use Bounding Box?
  - recognizes repeatedly in real-time
  - a smartphone is not fixed.

**GrabCut**

# Set up for Experiment

- Evaluation of processing time
  - device
    - Galaxy Note2(1.6GHz,4core,4thread, Android 4.1)
  - multi thread for Quad core
  
- Evaluation
  - processing time
  - average

# Estimation of the more reliable direction

- Effective window search
- No transposed SURF-BoF + linear SVM

- Linear SVM

$$\mathbf{w} = \mathbf{w}^+ + \mathbf{w}^-$$

- SVM score

- Create integral images about  $\mathbf{w}^+$  and  $\mathbf{w}^-$
- $O(1)$  operation ( ref ESS )

- Show the result

- The window with the maximum score

result

# Future Work

- Estimate direction
  - Consider other information such as shape
  - Move the bounding box automatically
- Draw bounding box
  - Make less complex such as touch just a point
- Use additional information
  - User's meal history
  - GPS and time information

# You can try it

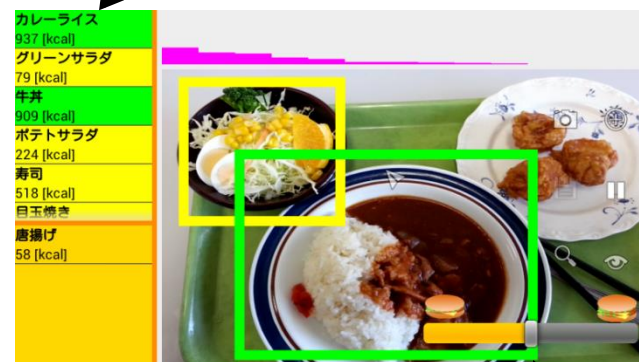

- The Android application can be downloaded.
  - We do not provide iOS version.
- Download site
  - <http://foodcam.mobi/>
  - Android 3.1 and up
  - Quad cores and up

# Objective

- To record food items in every meal
  - quite troublesome task.

**More Quickly and Easier**

## Recognition Result

Selected Food      Volume

- Proposed system
  - recognize food in **real-time**
  - require **no connection** with server
  - return results with **81.6%** in the top5.
